CACODEV

Nonprofit Organization Management System

Further Development Statement

Document ID	RS – 11
Version	1.0
Prepared By	David Katembo, Fabrice Kadima, Pemphyle Nzuzi
Date	2026-05/01
Classification	Internal
References	RS-6, RS-7, RS-8

With an additional year of development, CACODEV could be significantly enhanced through a set of high-impact improvements aimed at increasing scalability, functionality, and overall system efficiency. These enhancements would focus on expanding platform capabilities, improving user experience, strengthening performance and reliability, and enabling broader adoption across multiple organizations:

- Multi-tenancy and SaaS transformation: Refactor the platform into a multi-tenant architecture to allow multiple nonprofit organizations to onboard quickly, with strict data isolation and shared infrastructure.
- Native mobile applications: Develop iOS and Android apps using React Native or Flutter, leveraging the existing REST API to enable push notifications and mobile administrative actions.
- Advanced AI capabilities: Extend the AI assistant with context-aware features such as automated event summaries, financial trend analysis, natural language data queries, and anomaly detection in contribution patterns.
- Automated regulatory compliance reporting: Implement a document generation system to produce financial summaries, tax documents, and required regulatory filings based on system data.
- Performance testing and scalability: Complete performance testing, then containerize the system with Docker and deploy on Kubernetes to support horizontal scaling and zero-downtime updates.
- Expanded test coverage: Increase backend test coverage to at least 80% for service-layer components, introduce Test containers for better isolation, and complete previously omitted test scenarios.
- Enhanced access control: Implement fine-grained role-based access control with more detailed permission management.
- Advanced analytics and dashboards: Expand reporting capabilities with richer data visualization and insights.
- Payment provider integration: Add support for additional payment gateways beyond the current implementation.
- Internationalization: Introduce multi-language support to broaden accessibility.
- Microservices evolution: Improve performance and maintainability by transitioning toward a microservices-based architecture.
- Automated DevOps pipelines: Establish CI/CD pipelines to streamline testing, deployment, and system operations.
